

# exercise

- Enable IPv6 in FreeBSD

As user root, vi /etc/rc.conf and add:-

ipv6\_enable="YES"

add (manual) interface configuration:-

ipv6\_network\_interfaces="em0"

Use the above option to limit the interface to enable IPv6. By default it's "auto", meaning to enable IPv6 on all the interfaces.

ipv6\_ifconfig\_em0="2001:4348:0:219:196:200:219:X"

(where x is your pc number, eg.1, 2, 3 ...)

- Add the default router:-

ipv6\_defaultrouter="2001:4348:0:219:196:200:219:254"

- Reboot!

Test with traceroute6 and ping6

- g) to your neighbour's ipv6 address
- h) An external host e.g traceroute6 [www.afrinic.net](http://www.afrinic.net)

Open your browser and go to

<http://www.afrinic.net>
