BGP Best Current Practices

ISP Workshops

Configuring BGP

Where do we start?

IOS Good Practices

☐ ISPs should start off with the following BGP commands as a basic template:

```
router bgp 64511
  bgp deterministic-med
  distance bgp 200 200 200
  no synchronization
  no auto-summary
```

Replace with public ASN

Make ebgp and ibgp distance the same

☐ If supporting more than just IPv4 unicast neighbours

```
  no bgp default ipv4-unicast
```

■ Turns off IOS assumption that all neighbours will exchange IPv4 prefixes

Cisco IOS Good Practices

- BGP in Cisco IOS is permissive by default
- Configuring BGP peering without using filters means:
  - All best paths on the local router are passed to the neighbour
  - All routes announced by the neighbour are received by the local router
  - Can have disastrous consequences
- Good practice is to ensure that each eBGP neighbour has inbound and outbound filter applied:

```
router bgp 64511
 neighbor 1.2.3.4 remote-as 64510
 neighbor 1.2.3.4 prefix-list as64510-in in
 neighbor 1.2.3.4 prefix-list as64510-out out
```

What is BGP for??

What is an IGP not for?

BGP versus OSPF/ISIS

- Internal Routing Protocols (IGPs)
  - examples are ISIS and OSPF
  - used for carrying **infrastructure** addresses
  - **NOT** used for carrying Internet prefixes or customer prefixes
  - design goal is to **minimise** number of prefixes in IGP to aid scalability and rapid convergence

BGP versus OSPF/ISIS

- ❑ BGP used internally (iBGP) and externally (eBGP)
- ❑ iBGP used to carry
  - ■ some/all Internet prefixes across backbone
  - ■ customer prefixes
- ❑ eBGP used to
  - ■ exchange prefixes with other ASes
  - ■ implement routing policy

BGP versus OSPF/ISIS

- DO NOT:
  - distribute BGP prefixes into an IGP
  - distribute IGP routes into BGP
  - use an IGP to carry customer prefixes
- **YOUR NETWORK WILL NOT SCALE**

Aggregation

Aggregation

- Aggregation means announcing the address block received from the RIR to the other ASes connected to your network

- Subprefixes of this aggregate may be:
  - Used internally in the ISP network
  - Announced to other ASes to aid with multihoming

- Unfortunately too many people are still thinking about class Cs, resulting in a proliferation of /24s in the Internet routing table
  - May 2014: 263000 /24s in IPv4 table of 495000 prefixes

- The same is happening for /48s with IPv6
  - May 2014: 7300 /48s in IPv6 table of 17000 prefixes

Configuring Aggregation – Cisco IOS

- ISP has 101.10.0.0/19 address block
- To put into BGP as an aggregate:

```
router bgp 64511
  network 101.10.0.0 mask 255.255.224.0
  ip route 101.10.0.0 255.255.224.0 null0
```

- The static route is a "pull up" route
  - more specific prefixes within this address block ensure connectivity to ISP's customers
  - "longest match lookup

Aggregation

- Address block should be announced to the Internet as an aggregate

- Subprefixes of address block should NOT be announced to Internet unless for traffic engineering
    - See BGP Multihoming presentations

- Aggregate should be generated internally
   - Not on the network borders!

Announcing Aggregate – Cisco IOS

- Configuration Example

```
router bgp 64511
 network 101.10.0.0 mask 255.255.224.0
 neighbor 102.102.10.1 remote-as 101
 neighbor 102.102.10.1 prefix-list out-filter out
!
ip route 101.10.0.0 255.255.224.0 null0
!
ip prefix-list out-filter permit 101.10.0.0/19
ip prefix-list out-filter deny 0.0.0.0/0 le 32
```

Announcing an Aggregate

- ISPs who don't and won't aggregate are held in poor regard by community
- Registries publish their minimum allocation size
  - For IPv4:
    - Now ranging from a /20 to a /24 depending on RIR
    - Different sizes for different address blocks
    - (APNIC changed its minimum allocation to /24 in October 2010)
  - For IPv6:
    - /48 for assignment, /32 for allocation
- Until recently there was no real reason to see anything longer than a /22 IPv4 prefix in the Internet
  - Maybe IPv4 run-out is starting to have an impact?
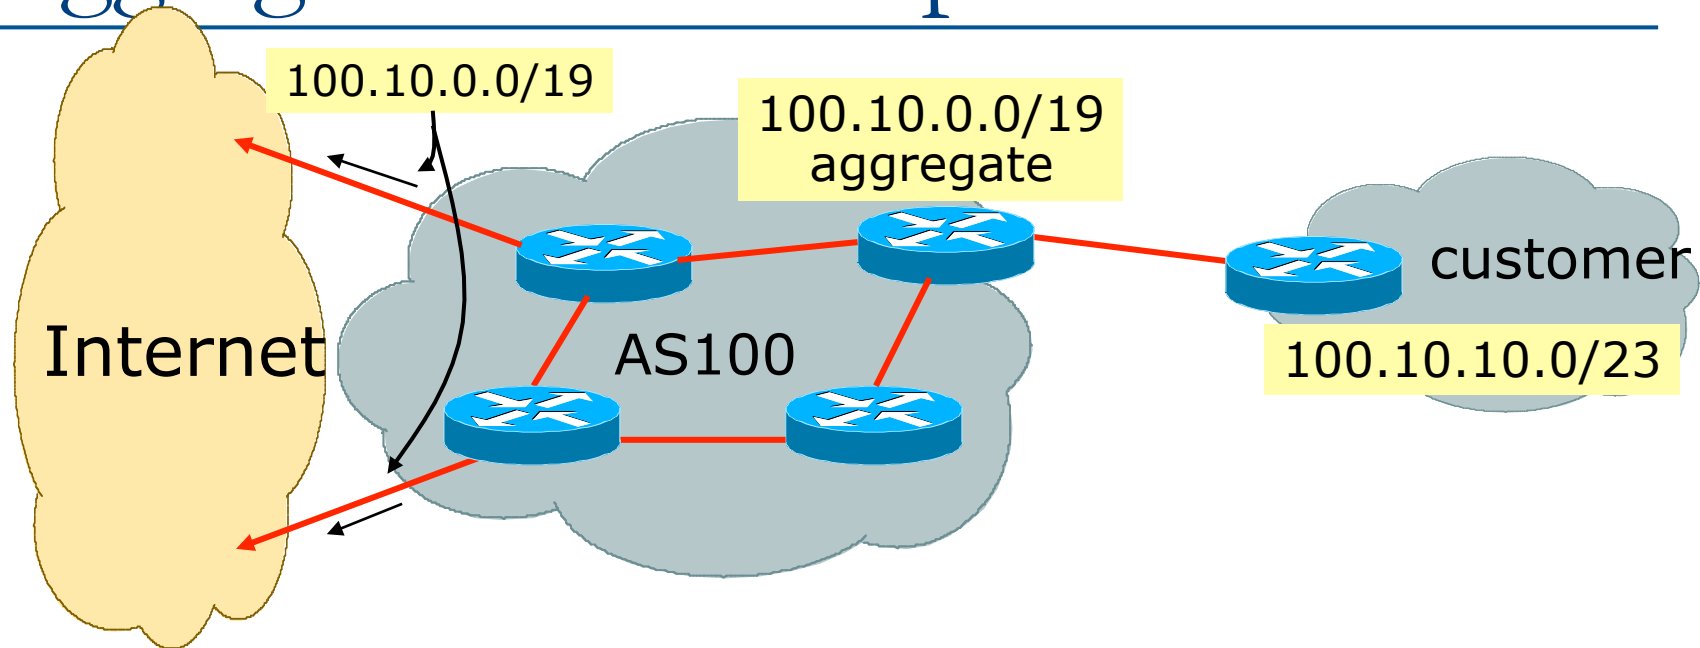

Aggregation – Example

100.10.10.0/23
100.10.0.0/24
100.10.4.0/22
…

Internet

AS100

customer

100.10.10.0/23
- Customer has /23 network assigned from AS100's /19 address block
- AS100 announces customers' individual networks to the Internet
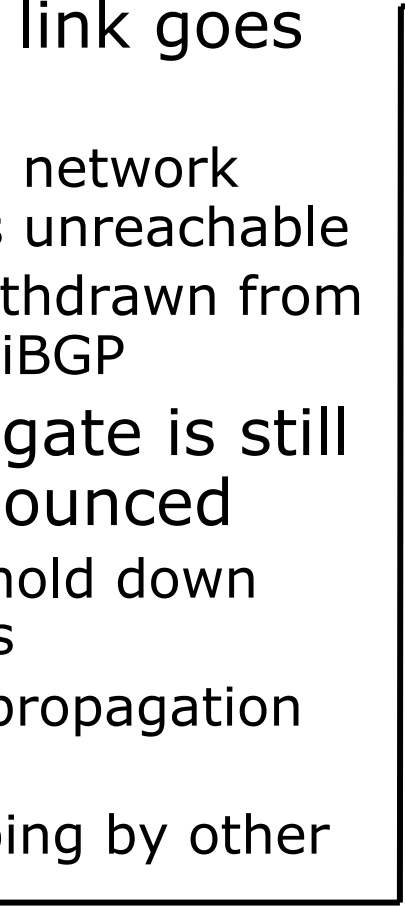

Aggregation – Bad Example

- Customer link goes down
  - Their /23 network becomes unreachable
  - /23 is withdrawn from AS100's iBGP
- Their ISP doesn't aggregate its /19 network block
  - /23 network withdrawal announced to peers
  - starts rippling through the Internet
  - added load on all Internet backbone routers as network is removed from routing table

- Customer link returns
  - Their /23 network is now visible to their ISP
  - Their /23 network is re-advertised to peers
  - Starts rippling through Internet
  - Load on Internet backbone routers as network is reinserted into routing table
  - Some ISP's suppress the flaps
  - Internet may take 10-20 min or longer to be visible
  - Where is the Quality of Service???

16

Aggregation – Example

100.10.0.0/19

100.10.0.0/19 aggregate

Internet

AS100

customer

100.10.10.0/23

- Customer has /23 network assigned from AS100's /19 address block
- AS100 announced /19 aggregate to the Internet

Aggregation – Good Example

- Customer link goes down
  - their /23 network becomes unreachable
  - /23 is withdrawn from AS100's iBGP
- /19 aggregate is still being announced
  - no BGP hold down problems
  - no BGP propagation delays
  - no damping by other ISPs

- Customer link returns
- Their /23 network is visible again
  - The /23 is re-injected into AS100's iBGP
- The whole Internet becomes visible immediately
- Customer has Quality of Service perception

18

Aggregation – Summary

- Good example is what everyone should do!
  - Adds to Internet stability
  - Reduces size of routing table
  - Reduces routing churn
  - Improves Internet QoS for **everyone**
- Bad example is what too many still do!
  - Why? Lack of knowledge?
  - Laziness?

Separation of iBGP and eBGP

- Many ISPs do not understand the importance of separating iBGP and eBGP
  - iBGP is where all customer prefixes are carried
  - eBGP is used for announcing aggregate to Internet and for Traffic Engineering
- Do NOT do traffic engineering with customer originated iBGP prefixes
  - Leads to instability similar to that mentioned in the earlier bad example
  - Even though aggregate is announced, a flapping subprefix will lead to instability for the customer concerned
- Generate traffic engineering prefixes on the Border Router

The Internet Today (May 2014)

- Current Internet Routing Table Statistics
  - BGP Routing Table Entries   494526
  - Prefixes after maximum aggregation   193973
  - Unique prefixes in Internet   244746
  - Prefixes smaller than registry alloc   171043
  - /24s announced   262628
  - ASes in use   46867

Efforts to improve aggregation

- The CIDR Report
  - Initiated and operated for many years by Tony Bates
  - Now combined with Geoff Huston's routing analysis
    - www.cidr-report.org
    - (covers both IPv4 and IPv6 BGP tables)
  - Results e-mailed on a weekly basis to most operations lists around the world
  - Lists the top 30 service providers who could do better at aggregating
- RIPE Routing WG aggregation recommendations
  - IPv4: RIPE-399 — www.ripe.net/ripe/docs/ripe-399.html
  - IPv6: RIPE-532 — www.ripe.net/ripe/docs/ripe-532.html

Efforts to Improve Aggregation
# The CIDR Report

- Also computes the size of the routing table assuming ISPs performed optimal aggregation
- Website allows searches and computations of aggregation to be made on a per AS basis
  - Flexible and powerful tool to aid ISPs
  - Intended to show how greater efficiency in terms of BGP table size can be obtained without loss of routing and policy information
  - Shows what forms of origin AS aggregation could be performed and the potential benefit of such actions to the total table size
  - Very effectively challenges the traffic engineering excuse

Status Summary

Table History

Date	Prefixes	CIDR Aggregated

64.81.59.0/24      4777 2516 3356 18566 - Withdrawn - matching aggregate 64.81.48.0/20 4777 2516 3356 18566
```

Importance of Aggregation

- Size of routing table
  - Router Memory is not so much of a problem as it was in the 1990s
  - Routers routinely carry over 1 million prefixes
- Convergence of the Routing System
  - This is a problem
  - Bigger table takes longer for CPU to process
  - BGP updates take longer to deal with
  - BGP Instability Report tracks routing system update activity
  - bgpupdates.potaroo.net/instability/bgpupd.html

The BGP Instability Report

The BGP Instability Report is updated daily. This report was generated on 17 May 2014 06:30 (UTC+1000)

50 Most active ASes for the past 7 days

RANK	ASN	UPDs	%	Prefixes	UPDs/Prefix	AS NAME

Receiving Prefixes

Receiving Prefixes

- There are three scenarios for receiving prefixes from other ASNs
  - Customer talking BGP
  - Peer talking BGP
  - Upstream/Transit talking BGP
- Each has different filtering requirements and need to be considered separately

Receiving Prefixes: From Customers

- ISPs should only accept prefixes which have been assigned or allocated to their downstream customer

- If ISP has assigned address space to its customer, then the customer IS entitled to announce it back to his ISP

- If the ISP has NOT assigned address space to its customer, then:
  - Check in the five RIR databases to see if this address space really has been assigned to the customer
  - The tool: whois –h jwhois.apnic.net x.x.x.0/24
    - (jwhois queries all RIR databases)

Receiving Prefixes:
From Customers

□ Example use of whois to check if customer is entitled to announce address space:

```
$ whois -h jwhois.apnic.net 202.12.29.0
inetnum:        202.12.28.0 - 202.12.29.255
netname:        APNIC-AP
descr:          Asia Pacific Network Information Centre
descr:          Regional Internet Registry for the Asia-Pacific
descr:          6 Cordelia Street
descr:          South Brisbane, QLD 4101
descr:          Australia
country:        AU
admin-c:        AIC1-AP
tech-c:         NO4-AP
mnt-by:         APNIC-HM
mnt-irt:        IRT-APNIC-AP
changed:        hm-changed@apnic.net
status:         ASSIGNED PORTABLE
changed:        hm-changed@apnic.net 20110309
source:         APNIC
```

Portable – means its an assignment to the customer, the customer can announce it to you

Receiving Prefixes:
From Customers

- Example use of whois to check if customer is entitled to announce address space:

```
$ whois -h whois.ripe.net 193.128.0.0
inetnum:        193.128.0.0 - 193.133.255.255
netname:        UK-PIPEX-193-128-133
descr:          Verizon UK Limited
country:        GB
org:            ORG-UA24-RIPE
admin-c:        WERT1-RIPE
tech-c:         UPHM1-RIPE
status:         ALLOCATED UNSPECIFIED
remarks:        Please send abuse notification to abuse@uk.uu.net
mnt-by:         RIPE-NCC-HM-MNT
mnt-lower:      AS1849-MNT
mnt-routes:     AS1849-MNT
mnt-routes:     WCOM-EMEA-RICE-MNT
mnt-irt:        IRT-MCI-GB
source:         RIPE # Filtered
```

ALLOCATED – means that this is Provider Aggregatable address space and can only be announced by the ISP holding the allocation (in this case Verizon UK)

34

Receiving Prefixes from customer: Cisco IOS

- For Example:
  - downstream has 100.50.0.0/20 block
  - should only announce this to upstreams
  - upstreams should only accept this from them
- Configuration on upstream

```
router bgp 100
 neighbor 102.102.10.1 remote-as 101
 neighbor 102.102.10.1 prefix-list customer in
!
ip prefix-list customer permit 100.50.0.0/20
```

Receiving Prefixes:
From Peers

- A peer is an ISP with whom you agree to exchange prefixes you originate into the Internet routing table
  - Prefixes you accept from a peer are only those they have indicated they will announce
  - Prefixes you announce to your peer are only those you have indicated you will announce

Receiving Prefixes:
From Peers

□ Agreeing what each will announce to the other:

- Exchange of e-mail documentation as part of the peering agreement, and then ongoing updates

OR

- Use of the Internet Routing Registry and configuration tools such as the IRRToolSet

www.isc.org/sw/IRRToolSet/

Receiving Prefixes from peer: Cisco IOS

- For Example:
  - Peer has 220.50.0.0/16, 61.237.64.0/18 and 81.250.128.0/17 address blocks
- Configuration on local router

```
router bgp 100
 neighbor 102.102.10.1 remote-as 101
 neighbor 102.102.10.1 prefix-list my-peer in
!
ip prefix-list my-peer permit 220.50.0.0/16
ip prefix-list my-peer permit 61.237.64.0/18
ip prefix-list my-peer permit 81.250.128.0/17
ip prefix-list my-peer deny 0.0.0.0/0 le 32
```

Receiving Prefixes:
From Upstream/Transit Provider

- Upstream/Transit Provider is an ISP who you pay to give you transit to the WHOLE Internet
- Receiving prefixes from them is not desirable unless really necessary
  - Traffic Engineering – see BGP Multihoming presentations
- Ask upstream/transit provider to either:
  - originate a default-route

    OR
  - announce one prefix you can use as default

Receiving Prefixes:
From Upstream/Transit Provider

□ Downstream Router Configuration

```
router bgp 100
  network 101.10.0.0 mask 255.255.224.0
  neighbor 101.5.7.1 remote-as 101
  neighbor 101.5.7.1 prefix-list infilter in
  neighbor 101.5.7.1 prefix-list outfilter out
!
ip prefix-list infilter permit 0.0.0.0/0
!
ip prefix-list outfilter permit 101.10.0.0/19
```

Receiving Prefixes:
From Upstream/Transit Provider

□ Upstream Router Configuration

```
router bgp 101
  neighbor 101.5.7.2 remote-as 100
  neighbor 101.5.7.2 default-originate
  neighbor 101.5.7.2 prefix-list cust-in in
  neighbor 101.5.7.2 prefix-list cust-out out
!
ip prefix-list cust-in permit 101.10.0.0/19
!
ip prefix-list cust-out permit 0.0.0.0/0
```

Receiving Prefixes:
From Upstream/Transit Provider

- If necessary to receive prefixes from any provider, care is required.
  - Don't accept default (unless you need it)
  - Don't accept your own prefixes
- Special use prefixes for IPv4 and IPv6:
  - http://www.rfc-editor.org/rfc/rfc6890.txt
- For IPv4:
  - Don't accept prefixes longer than /24 (?)
    - /24 was the historical class C
- For IPv6:
  - Don't accept prefixes longer than /48 (?)
    - /48 is the design minimum delegated to a site

Receiving Prefixes:
From Upstream/Transit Provider

- ❏ Check Team Cymru's list of "bogons"

  www.team-cymru.org/Services/Bogons/http.html

- ❏ For IPv4 also consult:

  www.rfc-editor.org/rfc/rfc6441.txt (BCP171)

- ❏ For IPv6 also consult:

  www.space.net/~gert/RIPE/ipv6-filters.html

- ❏ Bogon Route Server:

  www.team-cymru.org/Services/Bogons/routeserver.html

  - ◾ Supplies a BGP feed (IPv4 and/or IPv6) of address blocks which should not appear in the BGP table

Receiving IPv4 Prefixes

```
router bgp 100
 network 101.10.0.0 mask 255.255.224.0
 neighbor 101.5.7.1 remote-as 101
 neighbor 101.5.7.1 prefix-list in-filter in
!
ip prefix-list in-filter deny 0.0.0.0/0               ! Default
ip prefix-list in-filter deny 0.0.0.0/8 le 32         ! RFC1122 local host
ip prefix-list in-filter deny 10.0.0.0/8 le 32        ! RFC1918
ip prefix-list in-filter deny 100.64.0.0/10 le 32     ! RFC6598 shared addr

ipv6 prefix-list v6in-filter deny ::/0 le 128
```

Receiving Prefixes

- Paying attention to prefixes received from customers, peers and transit providers assists with:
    - The integrity of the local network
    - The integrity of the Internet
- Responsibility of all ISPs to be good Internet citizens

Prefixes into iBGP

Injecting prefixes into iBGP

- Use iBGP to carry customer prefixes
  - don't use IGP
- Point static route to customer interface
- Use BGP network statement
- As long as static route exists (interface active), prefix will be in BGP

Router Configuration: network statement

- Example:

```
interface loopback 0
 ip address 215.17.3.1 255.255.255.255
!
interface Serial 5/0
 ip unnumbered loopback 0
 ip verify unicast reverse-path
!
ip route 215.34.10.0 255.255.252.0 Serial 5/0
!
router bgp 100
 network 215.34.10.0 mask 255.255.252.0
```

Injecting prefixes into iBGP

- Interface flap will result in prefix withdraw and reannounce
  - use "`ip route . . . permanent`"
- Many ISPs redistribute static routes into BGP rather than using the network statement
  - Only do this if you understand why

Router Configuration: redistribute static

- Example:

```
ip route 215.34.10.0 255.255.252.0 Serial 5/0
!
router bgp 100
 redistribute static route-map static-to-bgp
<snip>
!
route-map static-to-bgp permit 10
 match ip address prefix-list ISP-block
 set origin igp
<snip>
!
ip prefix-list ISP-block permit 215.34.10.0/22 le 30
```

Injecting prefixes into iBGP

- ❑ Route-map ISP-block can be used for many things:
    - ■ setting communities and other attributes
    - ■ setting origin code to IGP, etc
- ❑ Be careful with prefix-lists and route-maps
    - ■ absence of either/both means all statically routed prefixes go into iBGP

Summary

- Best Practices Covered:
  - When to use BGP
  - When to use ISIS/OSPF
  - Aggregation
  - Receiving Prefixes
  - Prefixes into BGP

Configuration Tips

Of passwords, tricks and templates

iBGP and IGPs Reminder!

- Make sure loopback is configured on router
  - iBGP between loopbacks, NOT real interfaces
- Make sure IGP carries loopback IPv4 /32 and IPv6 /128 address
- Consider the DMZ nets:
  - Use unnumbered interfaces?
  - Use next-hop-self on iBGP neighbours
  - Or carry the DMZ IPv4 /30s and IPv6 /127s in the iBGP
  - Basically keep the DMZ nets out of the IGP!

iBGP: Next-hop-self

- BGP speaker announces external network to iBGP peers using router's local address (loopback) as next-hop

- Used by many ISPs on edge routers
  - Preferable to carrying DMZ point-to-point link addresses in the IGP
  - Reduces size of IGP to just core infrastructure
  - Alternative to using unnumbered interfaces
  - Helps scale network
  - Many ISPs consider this "best practice"

Limiting AS Path Length

- Some BGP implementations have problems with long AS_PATHS
    - Memory corruption
    - Memory fragmentation
- Even using AS_PATH prepends, it is not normal to see more than 20 ASes in a typical AS_PATH in the Internet today
    - The Internet is around 5 ASes deep on average
    - Largest AS_PATH is usually 16-20 ASNs

Limiting AS Path Length

- Some announcements have ridiculous lengths of AS-paths:

```
*> 3FFE:1600::/24      22 11537 145 12199 10318 10566 13193 1930 2200
    3425 293 5609 5430 13285 6939 14277 1849 33 15589 25336 6830 8002
    2042 7610 i
```

This example is an error in one IPv6 implementation

```

```

This example shows 100 prepends (for no obvious reason)

- If your implementation supports it, consider limiting the maximum AS-path length you will accept

BGP TTL "hack"

- Implement RFC5082 on BGP peerings
  - (Generalised TTL Security Mechanism)
  - Neighbour sets TTL to 255
  - Local router expects TTL of incoming BGP packets to be 254
  - No one apart from directly attached devices can send BGP packets which arrive with TTL of 254, so any possible attack by a remote miscreant is dropped due to TTL mismatch
BGP TTL "hack"

- TTL Hack:
  - Both neighbours must agree to use the feature
  - TTL check is much easier to perform than MD5
  - (Called BTSH – BGP TTL Security Hack)
- Provides "security" for BGP sessions
  - In addition to packet filters of course
  - MD5 should still be used for messages which slip through the TTL hack
  - See www.nanog.org/mtg-0302/hack.html for more details

Templates

- Good practice to configure templates for everything
  - Vendor defaults tend not to be optimal or even very useful for ISPs
  - ISPs create their own defaults by using configuration templates
- eBGP and iBGP examples follow
  - Also see Team Cymru's BGP templates
    - http://www.team-cymru.org/ReadingRoom/Documents/

iBGP Template Example

- iBGP between loopbacks!
- Next-hop-self
  - Keep DMZ and external point-to-point out of IGP
- Always send communities in iBGP
  - Otherwise accidents will happen
- Hardwire BGP to version 4
  - Yes, this is being paranoid!

iBGP Template
Example continued

- Use passwords on iBGP session
  - Not being paranoid, VERY necessary
  - It's a secret shared between you and your peer
  - If arriving packets don't have the correct MD5 hash, they are ignored
  - Helps defeat miscreants who wish to attack BGP sessions
- Powerful preventative tool, especially when combined with filters and the TTL "hack"

eBGP Template Example

- BGP damping
  - Do NOT use it unless you understand the impact
  - Do NOT use the vendor defaults without thinking
- Remove private ASes from announcements
  - Common omission today
- Use extensive filters, with "backup"
  - Use as-path filters to backup prefix filters
  - Keep policy language for implementing policy, rather than basic filtering
- Use password agreed between you and peer on eBGP session

eBGP Template Example continued

- □ Use maximum-prefix tracking
  - ■ Router will warn you if there are sudden increases in BGP table size, bringing down eBGP if desired
- □ Limit maximum as-path length inbound
- □ Log changes of neighbour state
  - ■ …and monitor those logs!
- □ Make BGP admin distance higher than that of any IGP
  - ■ Otherwise prefixes heard from outside your network could override your IGP!!

Summary

- Use configuration templates
- Standardise the configuration
- Be aware of standard "tricks" to avoid compromise of the BGP session
- Anything to make your life easier, network less prone to errors, network more likely to scale
- It's all about scaling – if your network won't scale, then it won't be successful

BGP Best Current Practices
