# Introduction

## Network Monitoring Tools

- Availability – Nagios
- Performance - Cacti

*Nagios actively monitors the **availability** of devices and services*

# Introduction

- Possibly the most used open source network monitoring software
- Web interface for viewing status, browsing history, scheduling downtime etc
- Sends out alerts via E-mail. Can be configured to use other mechanisms, e.g. SMS

# Example: Service Detail view

<a href="#">NS1-TLD6</a>	SSH	OK	2009-09-03 14:44:43	1d 22h 43m 43s	1/4	SSH OK - OpenSSH_5.1p1 Debian-3ubuntu1 (protocol 2.0)

# Features

Utilizes topology to determine dependencies.

- Differentiates between what is *down* vs. what is *unreachable*. Avoids running unnecessary checks and sending redundant alarms

Allows you to define how to send notifications based on combinations of:

- Contacts and lists of contacts
- Devices and groups of devices
- Services and groups of services
- Defined hours by persons or groups.
- The state of a service.

# Plugins

Plugins are used to verify services and devices:

- Nagios architecture is simple enough that writing new plugins is fairly easy in the language of your choice.
- There are **many, many** plugins available (thousands).
  - ✓ <http://exchange.nagios.org/>
  - ✓ <http://nagiosplugins.org/>

# Pre-installed plugins in Debian/ Ubuntu

## /usr/lib/nagios/plugins

```
check_apt      check_file_age  check_jabber   check_nntp     check_procs    check_swap
check_bgpstate check_flexlm    check_ldap     check_nntp     check_radius   check_tcp
check_breeze   check_ftp       check_ldaps    check_nt       check_real     check_time
check_by_ssh   check_host      check_linux_raid check_ntp      check_rpc      check_udp
check_clamd    check_hpjd      check_load     check_ntp_peer check_rta_multi check_ups
check_cluster check_http      check_log      check_ntp_time check_sensors   check_users
check_dhcp     check_icmp      check_mailq    check_nwstat   check_simap     check_wave
check_dig      check_ide_smart check_mrtg     check_oracle   check_smtp      negate
check_disk     check_ifoperstatus check_mrtgtraf check_overcr   check_snmp      urlize
check_disk_smb check_ifstatus  check_mysql    check_pgsql    check_spop      utils.pm
check_dns      check_imap     check_mysql_query check_ping     check_ssh       utils.sh
check_dummy    check_ircd     check_nagios   check_pop      check_ssmtp
```

## /etc/nagios-plugins/config

```
apt.cfg      dns.cfg      games.cfg    load.cfg     netware.cfg  ping.cfg     snmp.cfg
breeze.cfg   dummy.cfg    hppjd.cfg   mail.cfg     news.cfg     procs.cfg    ssh.cfg
dhcp.cfg     flexlm.cfg  http.cfg    mailq.cfg    nt.cfg       radius.cfg   tcp_udp.cfg
disk.cfg     fping.cfg   ifstatus.cfg mrtg.cfg    ntp.cfg     real.cfg     telnet.cfg
disk-smb.cfg ftp.cfg     ldap.cfg    mysql.cfg    pgsql.cfg    rpc-nfs.cfg  users.cfg
```

# How checks work

- Periodically Nagios calls a plugin to test the state of each service. Possible responses are:
  - OK
  - WARNING
  - CRITICAL
  - UNKNOWN
- If a service is not OK it goes into a “soft” error state. After a number of retries (default 3) it goes into a “hard” error state. At that point an alert is sent.
- You can also trigger external event handlers based on these state transitions

# How checks work continued

## Parameters

- Normal checking interval
- Retry interval (i.e. when not OK)
- Maximum number of retries
- Time period for performing checks
- Time period for sending notifications

## Scheduling

- Nagios spreads its checks throughout the time period to even out the workload
- Web UI shows when next check is scheduled

# The concept of “parents”

## Hosts can have parents:

- The parent of a **PC** connected to a **switch** would be the **switch**.
- Allows us to specify the dependencies between devices.
- Avoids sending alarms when parent does not respond.
- A node can have multiple parents (dual homed).

# Network viewpoint

- Where you locate your Nagios server will determine your point of view of the network.
- The Nagios server becomes the “root” of your dependency tree

# Network viewpoint

# Demo Nagios

# Installation

## In Debian/Ubuntu

```
# apt-get install nagios3
```

## Key directories

```
/etc/nagios3
```

```
/etc/nagios3/conf.d
```

```
/etc/nagios-plugins/config
```

```
/usr/lib/nagios/plugins
```

```
/usr/share/nagios3/htdocs/images/logos
```

**Nagios web interface is here:**

<http://pcX.sse.ws.afnog.org/nagios3/>

# Configuration

- Configuration defined in text files
  - /etc/nagios3/conf.d/\*.cfg
  - Details at [http://nagios.sourceforge.net/docs/3\\_0/objectdefinitions.html](http://nagios.sourceforge.net/docs/3_0/objectdefinitions.html)
- The default config is broken into several files with different objects in different files, but actually you can organise it how you like
- Always verify before restarting Nagios – otherwise your monitoring system may die!
  - `nagios3 -v /etc/nagios3/nagios.cfg`

# Hosts and services configuration

## Based on templates

- This saves lots of time avoiding repetition

## There are default templates with default parameters for a:

- *generic host* (generic-host\_nagios2.cfg)
- *generic service* (generic-service\_nagios2.cfg)
- Individual settings can be overridden
- Defaults are all sensible

# Monitoring a single host

## pcs.cfg

```
define host {
    host_name pc1
    alias      pc1 in group 1
    address    pc1.ws.nsrc.org
    use        generic-host
}
```

← copy settings from this template

- This is a minimal working config
  - You are just pinging the host; Nagios will warn that you are not monitoring any services
- The filename can be anything ending **.cfg**
- Organise your devices however you like – e.g. related hosts in the same file

# Generic host template

## generic-host nagios2.cfg

```
define host {
    name                generic-host    ; The name of this host template
    notifications_enabled 1                ; Host notifications are enabled
    event_handler_enabled 1                ; Host event handler is enabled
    flap_detection_enabled 1               ; Flap detection is enabled
    failure_prediction_enabled 1           ; Failure prediction is enabled
    process_perf_data     1                ; Process performance data
    retain_status_information 1            ; Retain status information across program restarts
    retain_nonstatus_information 1         ; Retain non-status information across restarts
    check_command          check-host-alive
    max_check_attempts     10
    notification_interval  0
    notification_period    24x7
    notification_options   d,u,r
    contact_groups         admins
    register                0                ; DON'T REGISTER THIS DEFINITION -
                                ; IT'S NOT A REAL HOST, JUST A TEMPLATE!
}
```

# Overriding defaults

All settings can be overridden per host

## pcs.cfg

```
define host {
    host_name          pc1
    alias              pc1 in group 1
    address            pc1.ws.nsrc.org
    use                generic-host
    notification_interval 120
    contact_groups      admins,managers
}
```

# Defining services (direct way)

## pcs.cfg

```
define host {
    host_name      pc1
    alias          pc1 in group 1
    address        pc1.ws.nsrc.org
    use            generic-host
}

define service {
    host_name          pc1
    service_description HTTP
    check_command      check_http
    use                generic-service
}

define service {
    host_name          pc1
    service_description SSH
    check_command      check_ssh
    use                generic-service
}
```

service "pc1,HTTP"

plugin

service template

# Service checks

- The combination of host + service is a unique identifier for the service check, e.g.
  - “pc1,HTTP”
  - “pc1,SSH”
  - “pc2,HTTP”
  - “pc2,SSH”
- *check\_command* points to the plugin
- *service template* pulls in settings for how often the check is done, and who and when to alert

# Generic service template

## generic-service\_nagios2.cfg\*

```
define service{
    name generic-service
    active_checks_enabled 1
    passive_checks_enabled 1
    parallelize_check 1
    obsess_over_service 1
    check_freshness 0
    notifications_enabled 1
    event_handler_enabled 1
    flap_detection_enabled 1
    failure_prediction_enabled 1
    process_perf_data 1
    retain_status_information 1
    retain_nonstatus_information 1
    notification_interval 0
    is_volatile 0
    check_period 24x7
    normal_check_interval 5
    retry_check_interval 1
    max_check_attempts 4
    notification_period 24x7
    notification_options w,u,c,r
    contact_groups admins
    register 0 ; DONT REGISTER THIS DEFINITION
}
```

\*Comments have been removed.

# Overriding defaults

Again, settings can be overridden per service

## services\_nagios2.cfg

```
define service {
    host_name                pc1
    service_description      HTTP
    check_command             check_http
    use                       generic-service
    contact_groups         admins,managers
    max_check_attempts    3
}
```

# Repeated service checks

- Often we are monitoring an identical service on many hosts
- To avoid duplication, a better way is to define a service check for all hosts in a *hostgroup*

# Creating hostgroups

## hostgroups\_nagios2.cfg

```
define hostgroup {
    hostgroup_name    http-servers
    alias             HTTP servers
    members         pc1,pc2
}

define hostgroup {
    hostgroup_name    ssh-servers
    alias             SSH servers
    members         pc1,pc2
}
```

# Monitoring services in hostgroups

## services\_nagios2.cfg

```
define service {
    hostgroup_name      http-servers
    service_description  HTTP
    check_command        check_http
    use                  generic-service
}

define service {
    hostgroup_name      ssh-servers
    service_description  SSH
    check_command        check_ssh
    use                  generic-service
}
```

e.g. if hostgroup “http-servers” contains pc1 and pc2 then Nagios creates HTTP service checks for both hosts. The service checks are called “pc1,HTTP” and “pc2,HTTP”

# Alternative view

- Instead of saying “this hostgroup contains these PCs” you can say “this PC belongs to these hostgroups”
- No need for the “members” line in hostgroups file

# Alternative group membership

## pcs.cfg

```
define host {
    host_name      pc1
    alias          pc1 in group 1
    address        pc1.ws.nsrc.org
    use            generic-host
    hostgroups   ssh-servers,http-servers
}

define host {
    host_name      pc2
    alias          pc2 in group 1
    address        pc2.ws.nsrc.org
    use            generic-host
    hostgroups   ssh-servers,http-servers
}
```

Hosts and services conveniently defined in the same place

# Other uses for hostgroups

## Choosing icons for the status map

### pcs.cfg

```
define host {
    host_name      pc1
    alias          pc1 in group 1
    address        pc1.ws.nsrc.org
    use            generic-host
    hostgroups     ssh-servers,http-servers,debian-servers
}
```

### extinfo\_nagios2.cfg

```
define hostextinfo {
    hostgroup_name    debian-servers
    notes              Debian GNU/Linux servers
    icon_image         base/debian.png
    statusmap_image    base/debian.gd2
}
```

# Optional: servicegroups

- You can also group together services into a “servicegroup”
- This is so related or dependent services can be viewed together in the web interface
- The services themselves must already exist

## servicegroups.cfg

```
define servicegroup {
    servicegroup_name    mail-services
    alias                Services comprising the mail platform
    members              web1,HTTP,web2,HTTP,mail1,IMAP,db1,MYSQL
}
```

# Configuring topology

## pcs.cfg

```
define host {
    host_name      pc1
    alias          pc1 in group 1
    address        pc1.ws.nsrc.org
    use            generic-host
    parents       rtr1 ← parent host
}
```

- This means “pc1 is on the far side of rtr1”
- If rtr1 goes down, pc1 is marked “unreachable” rather than “down”
- Prevents a cascade of alerts if rtr1 goes down
- Also allows Nagios to draw cool status map

# Another view of configuration

## RTR

```
define host {  
  use generic-host  
  host_name rtr  
  alias Gateway Router  
  address 10.10.0.254 }  
}
```

## SW

```
define host {  
  use generic-host  
  host_name sw  
  alias Backbone Switch  
  address 10.10.0.253  
  parents rtr }  
}
```

## RTR3

```
define host {  
  use generic-host  
  host_name rtr3  
  alias router 3  
  address 10.10.3.254  
  parents sw }  
}
```

## PC11...

# Out-of-Band (OOB) notifications

A critical item to remember: an SMS or message system that is independent from your network.

- You can utilize a cell phone connected to the Nagios server, or a USB dongle with SIM card
- You can use packages like:

**gammu:** <http://wammu.eu/>

**gnokii:** <http://www.gnokii.org/>

**sms-tools:** <http://smstools3.kekekasvi.com/>

# Additional Details

A few additional slides you may find useful or informative...

# Features, features, features...

- Allows you to acknowledge an event.
  - A user can add comments via the GUI
- You can define maintenance periods
  - By device or a group of devices
- Maintains availability statistics and generates reports
- Can detect flapping and suppress additional notifications.
- Allows for multiple notification methods:
  - e-mail, pager, SMS, winpopup, audio, etc...
- Allows you to define notification levels for escalation

# NAGIOS - NOTIFICATION FLOW DIAGRAM

# Notification Options (Host)

## Host state:

When configuring a host you can be notified on the following conditions:

- **d**: DOWN
- **u**: UNREACHABLE
- **r**: RECOVERY
- **f**: FLAPPING (start/end)
- **s**: SCHEDULED DOWNTIME (start/end)
- **n**: NONE

# Notification Options (Service)

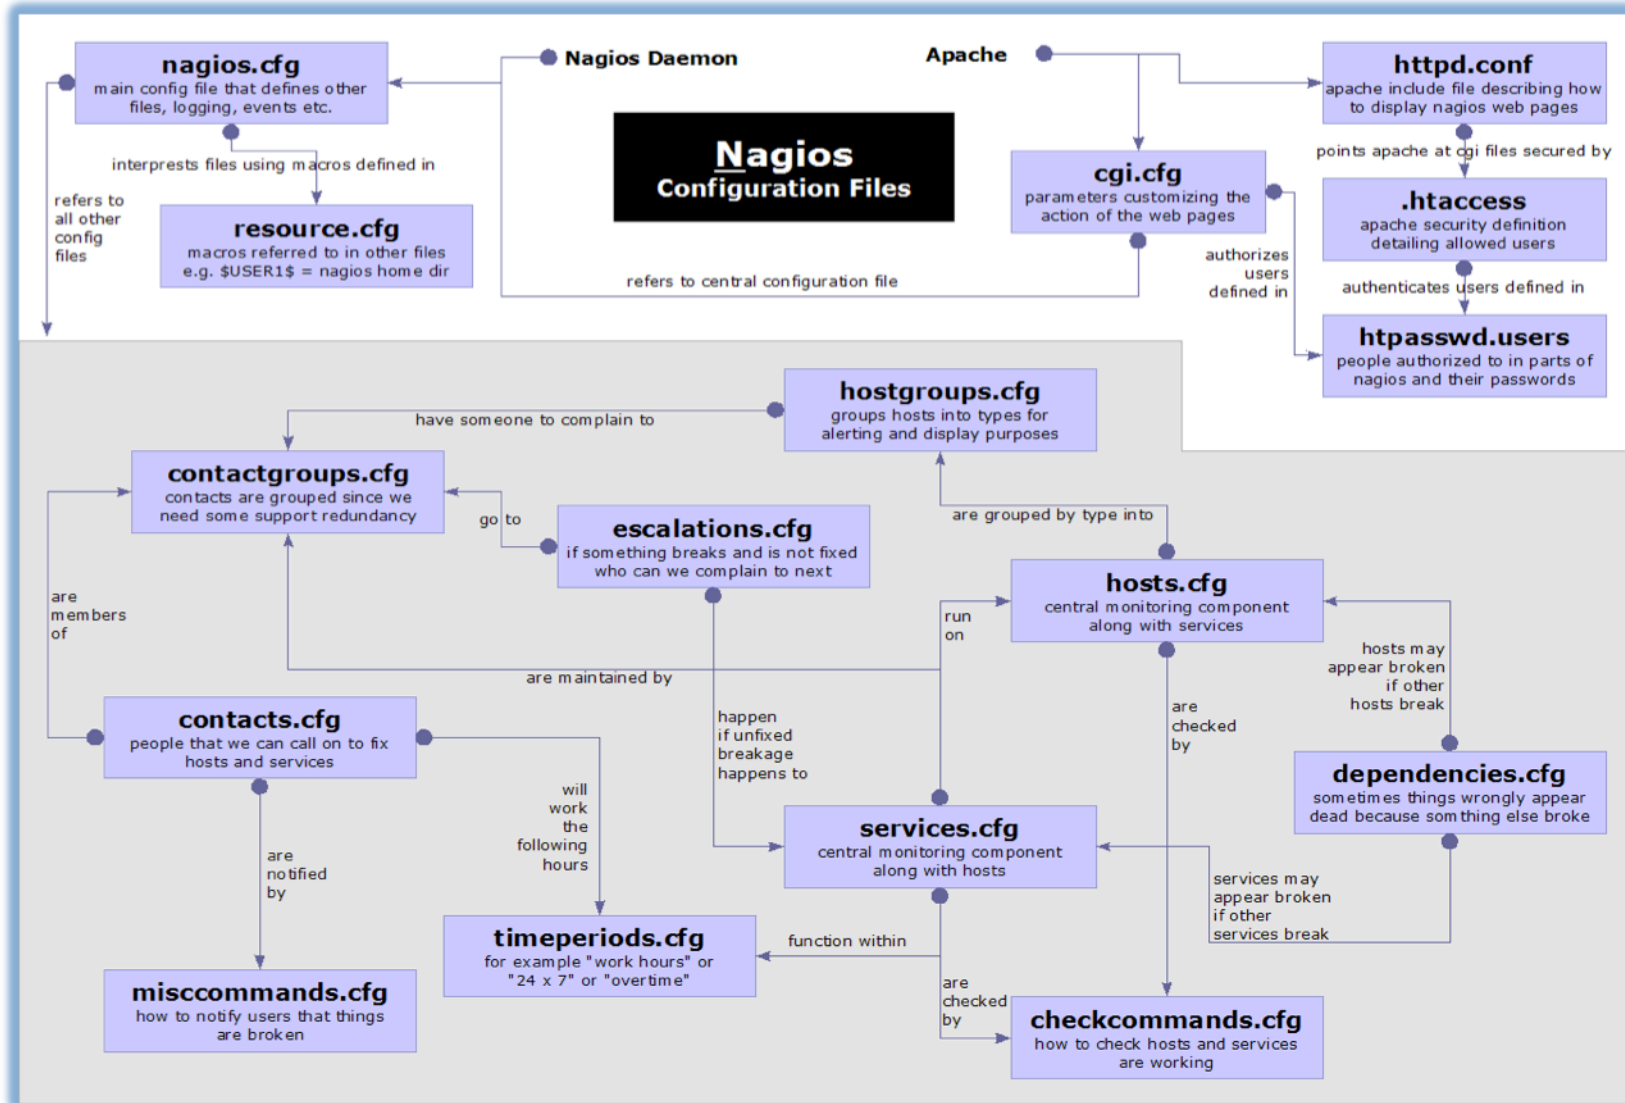

## Service state:

When configuring a service you can be notified on the following conditions:

- **w**: WARNING
- **c**: CRITICAL
- **u**: UNKNOWN
- **r**: RECOVERY
- **f**: FLAPPING (start/end)
- **s**: SCHEDULED DOWNTIME (start/end)
- **n**: NONE

# Configuration files (Official)

# Debian/Ubuntu config file layout

Located in `/etc/nagios3/`

Important files include:

- `nagios.cfg` Main configuration file.
- `cgi.cfg` Controls the web interface and security options.
- `commands.cfg` The commands that Nagios uses for notifications.
- `conf.d/*` All other configuration goes here!

# Configuration files continued

## Under conf.d/\*

- `contacts_nagios2.cfg` users and groups
- `extinfo_nagios2.cfg` make your UI pretty
- `generic-host_nagios2.cfg` default host template
- `generic-service_nagios2.cfg` default service template
- `host-gateway_nagios3.cfg` upstream router definition
- `hostgroups_nagios2.cfg` groups of nodes
- `localhost_nagios2.cfg` definition of nagios host
- `services_nagios2.cfg` what services to check
- `timeperiods_nagios2.cfg` when to check who to notify

# Configuration files continued

## Under conf.d some other possible config files:

- `servicegroups.cfg`      Groups of nodes and services
- `servers.cfg`              Sample definition of servers
- `switches.cfg`              Definitions of switches (hosts)
- `routers.cfg`                Definitions of routers (hosts)

# Main configuration details

## Global settings

**File:** `/etc/nagios3/nagios.cfg`

- Says where other configuration files are.
- General Nagios behavior:
  - For large installations you should tune the installation via this file.
  - See: *Tunning Nagios for Maximum Performance*  
[http://nagios.sourceforge.net/docs/3\\_0/tuning.html](http://nagios.sourceforge.net/docs/3_0/tuning.html)

# CGI configuration

## `/etc/nagios3/cgi.cfg`

- You can change the CGI directory if you wish
- Authentication and authorization for Nagios use:
  - Activate authentication via Apache's `.htpasswd` mechanism, or using RADIUS or LDAP.
  - Users can be assigned rights via the following variables:
    - `authorized_for_system_information`
    - `authorized_for_configuration_information`
    - `authorized_for_system_commands`
    - `authorized_for_all_services`
    - `authorized_for_all_hosts`
    - `authorized_for_all_service_commands`
    - `authorized_for_all_host_commands`

# Time Periods

This defines the base periods that control checks, notifications, etc.

- Defaults: 24 x 7
- Could adjust as needed, such as work-week only.
- Could adjust a new time period for “outside of regular hours”, etc.

```
# '24x7'  
define timeperiod{  
    timeperiod_name 24x7  
    alias            24 Hours A Day, 7 Days A Week  
    sunday           00:00-24:00  
    monday           00:00-24:00  
    tuesday          00:00-24:00  
    wednesday        00:00-24:00  
    thursday         00:00-24:00  
    friday           00:00-24:00  
    saturday         00:00-24:00  
}
```

# Configuring service/host checks

## /etc/nagios-plugins/config/ssh.cfg

```
define command {
    command_name    check_ssh
    command_line    /usr/lib/nagios/plugins/check_ssh '$HOSTADDRESS$'
}

define command {
    command_name    check_ssh_port
    command_line    /usr/lib/nagios/plugins/check_ssh -p '$ARG1$' '$HOSTADDRESS$'
}
```

- Notice the same plugin can be invoked in different ways (“commands”)
- Command and arguments are separated by exclamation marks (!)
- e.g. to check SSH on a non-standard port, you can do it like this:

```
define service {
    hostgroup_name    ssh-servers-2222
    service_description    SSH-2222
    check_command      check_ssh_port!2222
    use                generic-service
}
```

this is \$ARG1\$

# Notification commands

Allows you to utilize any command you wish.  
We could use this to generate tickets in RT.

```
# 'notify-by-email' command definition
define command{
    command_name    notify-by-email
    command_line    /usr/bin/printf "%b" "Service: $SERVICEDESC$\nHost:
$HOSTNAME$\nIn: $HOSTALIAS$\nAddress: $HOSTADDRESS$\nState: $SERVICESTATE$
\nInfo: $SERVICEOUTPUT$\nDate: $SHORTDATETIME$" | /bin/mail -s
'$NOTIFICATIONTYPE$: $HOSTNAME$/$SERVICEDESC$ is $SERVICESTATE$'
$CONTACTEMAIL$
}
```

```
From: nagios@nms.localdomain
To: router_group@localdomain
Subject: Host DOWN alert for TLD1-RTR!
Date: Thu, 29 Jun 2006 15:13:30 -0700
```

```
Host: gw-rtr
In: Core_Routers
State: DOWN
Address: 192.0.2.100
Date/Time: 06-29-2006 15:13:30
Info: CRITICAL - Plugin timed out after 6 seconds
```

# Group service configuration

```
# check that ssh services are running
define service {
    hostgroup_name      ssh-servers
    service_description SSH
    check_command       check_ssh
    use                 generic-service
    notification_interval 0
}
```

The “service\_description” is important if you plan to create Service Groups. Here is a sample Service Group definition:

```
define servicegroup{
    servicegroup_name  Webmail
    alias              web-mta-storage-auth
    members            srvr1,HTTP,srvr1,SMTP,srvr1,POP, \
                    srvr1,IMAP,srvr1,RAID,srvr1,LDAP, \
                    srvr2,HTTP,srvr2,SMTP,srvr2,POP, \
                    srvr2,IMAP,srvr2,RAID,srvr2,LDAP
}
```
